You need to copy the **appdata** and **projects** folders to the directory of the new version of the application

Opening the application package

Copy the appdata and projects folders somewhere (make a backup copy)

< > NeoEditor	≔≎	000 000 ~	Û	\bigcirc
Name				
✓ Contents				
> 🚞 Frameworks				
Info.plist				
✓				
> 🚞 appdata				
ffmpeg				
ffplay				
ffprobe				
melt				
NeoEditor				
> 💼 projects				
PkgInfo				
> 🚞 PlugIns				
> 🚞 Resources				

Then install the new version of the application as before: mount the dmg image and drag the application icon to Applications

This way the application will be completely overwritten with a new one

Next, you need to open the application package in the same way and copy **appdata** and **projects** from the backup there, i.e. saved earlier from the previous version of the application
